

Care of your Vitroglaze™ Treated Glass

Congratulations on the purchase of Vitroglaze™ treatment for your glass. Vitroglaze™ will continue to protect your investment by protecting the treated glass from discolouration and etching from mineral deposits and hard water scaling.

Vitroglaze™ will also reduce the frequency and difficulty of cleaning your glass. The following maintenance is recommended to maintain the pristine appearance of your treated glass:

- If applied to a shower screen – Surfaces need to be cleaned each week using a damp microfibre cloth and Vitroclean to remove any soap scum, dirt or grime from the surface.
- If applied to outdoor glass - Surfaces such as railings, pool balustrades and windows, clean as required using water and Vitroclean. Wash the glass with a microfibre cloth, and dry with a good quality squeegee.
- The use of harsh chemicals especially Acid based products of pH 6 or less and Alkaline based products of pH 9 or more will have adverse affect to the treated surface.
- For areas with hard water due to high mineral deposits that can cause limescale - A solution of 1 part white vinegar and 4 parts water should be sprayed onto the glass and allowed to soak for 3 - 5 minutes. Re-spray the glass with the vinegar solution and then wipe firmly with a microfibre cloth. A stronger dilution of vinegar to water can be used if needed.
- In extreme hard water areas - We recommended using the vinegar / water solution (listed above) once a week to reduce this builds up on the surface.
- Never use abrasive products to clean the glass. Vitroglaze™ is chemically bonded to the glass however persistent use of abrasives will remove the surface of the glass.
